

## **IN THE ABSTRACT:**

Please amend the Abstract as follows:

A method of controlling the ~~torque transferred across each of the two clutches~~ of a dual clutch transmission during a two-gear positive downshift, wherein the first ~~of the two clutches~~ clutch drives an initial gear and the final gear and the second ~~of the two clutches~~ clutch drives an intermediate gear. ~~The method includes the steps of determining a clutch torque and slip profile for the changeover of the clutches and determining a target engine speed profile.~~ The torque transfer across each clutch is ~~simultaneously~~ controlled so that the torque output of the transmission will be linearly changed over from the first clutch to the second clutch to cause the engine to track ~~[[the]]~~ a target engine speed profile. ~~When the first clutch is slipping at a greater rate than the second clutch the~~ The method changes over the gears driven by the first clutch by disengaging the synchronizer of from the initial gear and engaging the synchronizer of to the final gear as the engine continues to track the target speed. The torque transfer across each clutch is ~~simultaneously~~ controlled so that the torque output ~~of the transmission~~ will be linearly changed back from the second clutch to the first clutch in an inversely proportional rate to continue to cause the engine to track the target engine speed profile.
